

Stop the Spread

Protect Your Flock from Avian Influenza

An effectively implemented comprehensive biosecurity program is the most important means to prevent the transmission of diseases such as highly pathogenic avian influenza (HPAI), for the purpose of protecting both people and animals.

Your biosecurity measures must prevent access to bird housing and exposure to any environmental contamination.

Maintain your flock in a manner to limit the activity of migratory wild birds in and around the premise

Wildlife and migratory bird management practices include the removal of environmental conditions favorable to habitation

Prevent access of wildlife and migratory birds to eliminate potential sources of contamination

Implement deterrent measures for wildlife and migratory birds

Stop the Spread

Protect Your Flock from Avian Influenza

A thorough cleaning and disinfection protocol is a vital component of a comprehensive biosecurity program necessary to neutralize and eliminate harmful infectious agents. This cleaning and disinfecting process must be designed to effectively address all areas of potential contamination to include various surfaces, as well as all materials and equipment used to manage your backyard flock. Proper personal hygiene and the use of personal protective equipment (PPE) is also beneficial in protecting the health of personnel on the premises.

SYNERGIZE®

Synergize is an EPA-approved, broad-spectrum glutaraldehyde-quaternary ammonium disinfectant with labeled efficacy against avian influenza for use on already cleaned hard, non-porous, surfaces of buildings and equipment without animals present*.

*EPA-approved products must be used in strict accordance with their labels.
